

Finite MLPs can be treated as analytic approximations of infinite width MLPs

ReLU MLPs Can Compute Numerical Integration Mechanistic Interpretation of a Non-linear Activation

We build upon Nanda 2023 and Zhong 2023 interpretations of the “pizza” modular addition transformer model, which has a **black-box treatment of its MLP**.

We can sort the neurons by phase and plot one rectangle for each neuron. Given the input $x + y$, the contributions of neurons to the $z = x + y$ logit look remarkably like **numerical integration**.

We plot here $x + y = z = 0$.

$$\int_{-\pi}^{\pi} \underbrace{\text{ReLU}(\cos(k(x+y)/2 + \phi)) \cos(kz + 2\phi)}_{f(\phi)} d\phi = \frac{2}{3} \cos(k(x+y-z))$$

While we cannot compactly describe the behavior of 128 MLP neurons individually, we look for continuous functions capturing the **aggregate input behavior**, treating the finite-width MLP as an approximation of some **infinite-width** counterpart.

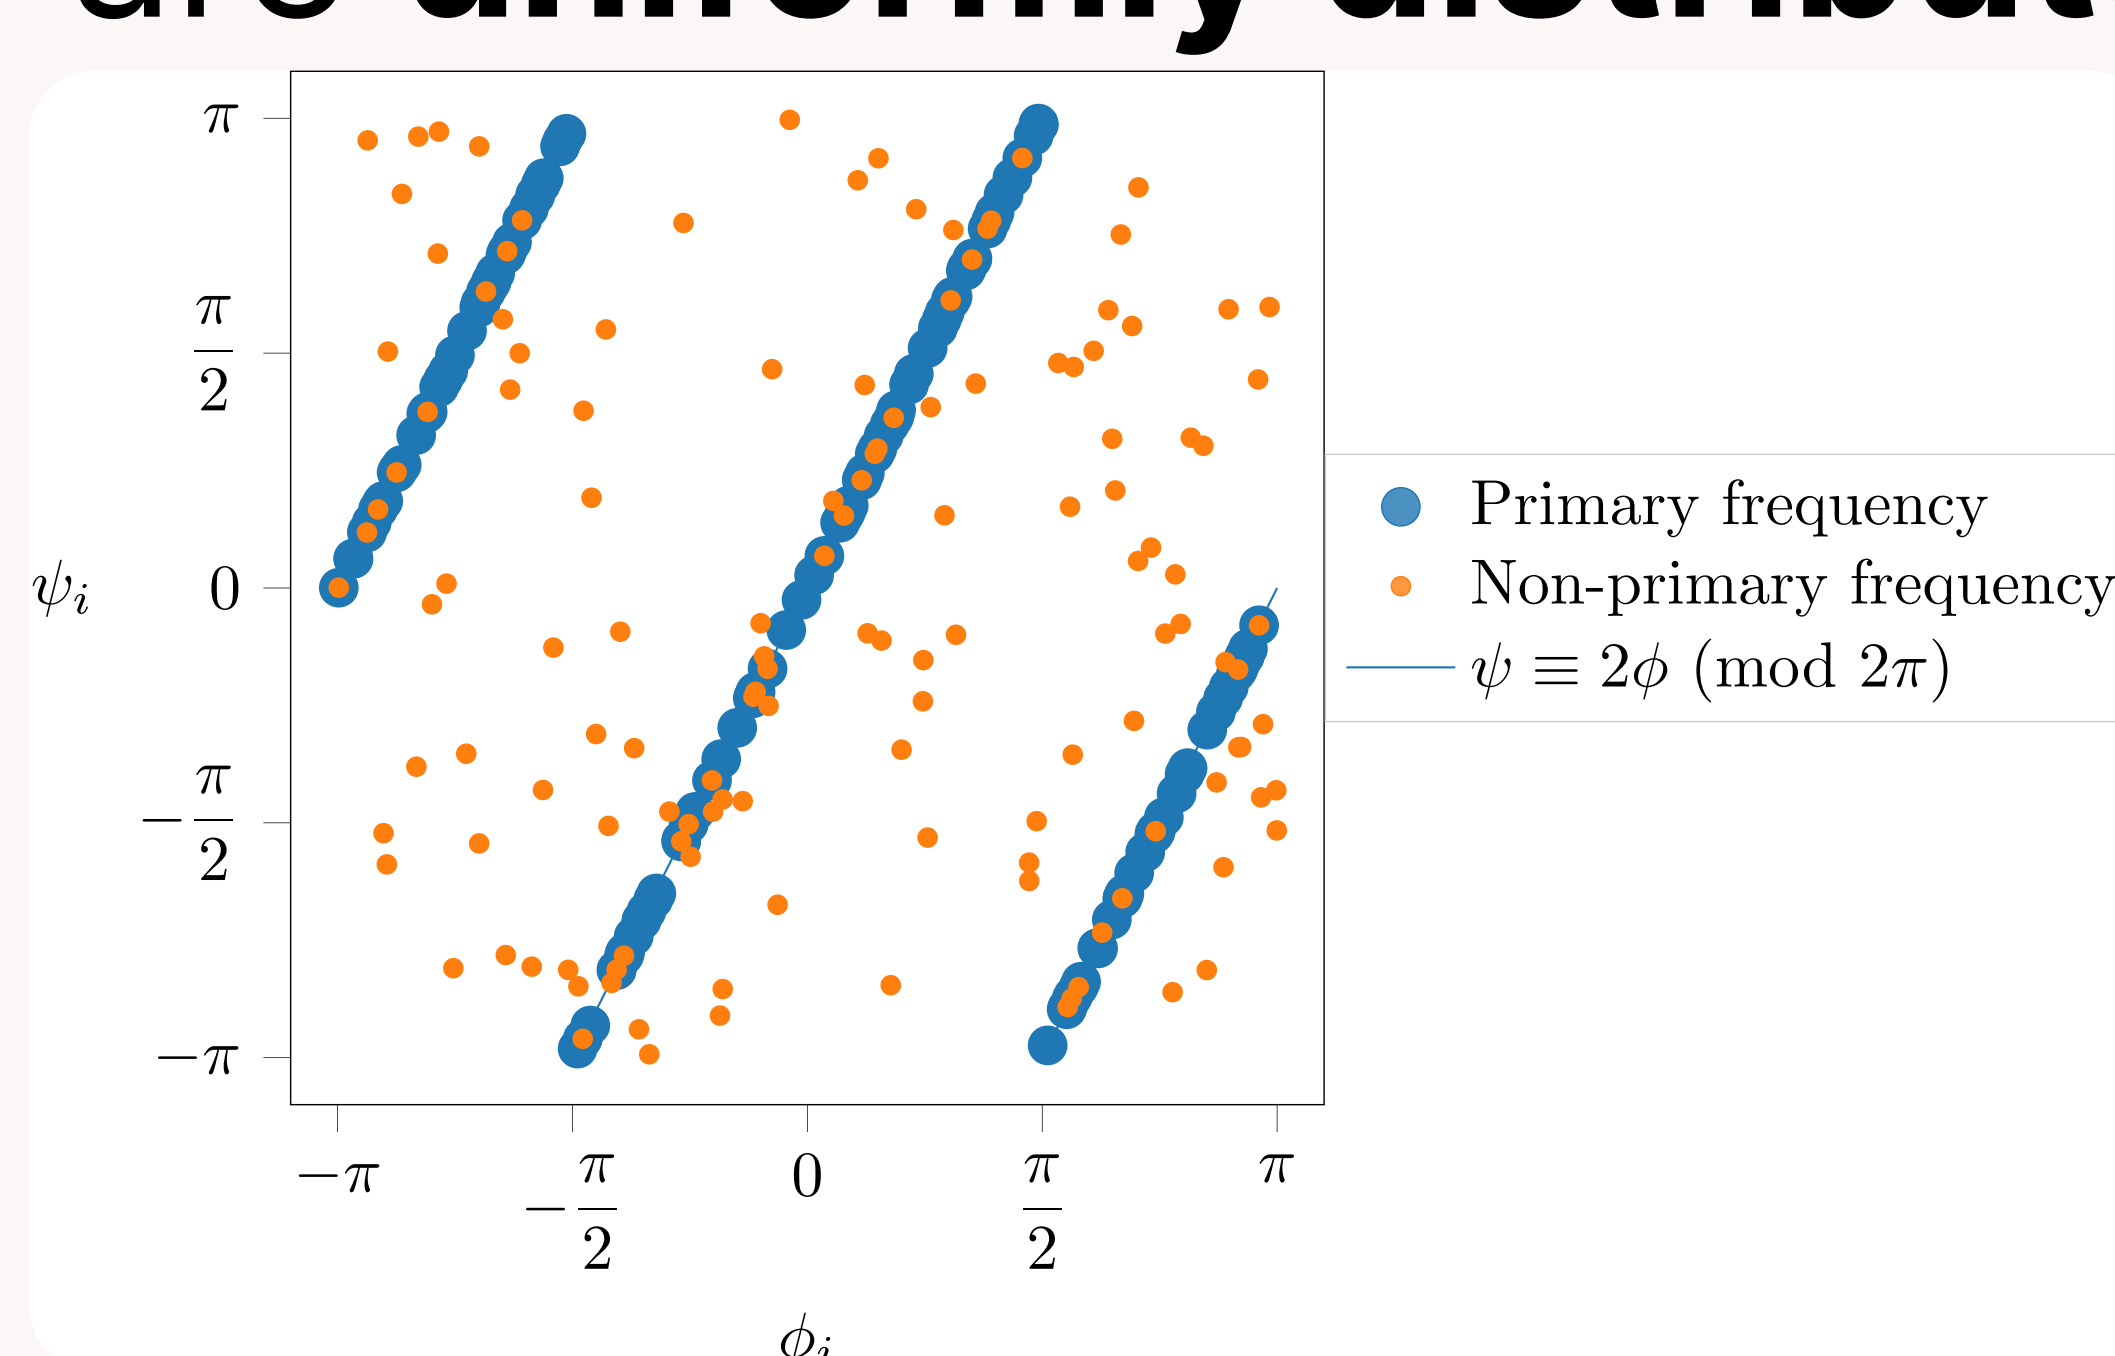

We confirm this interpretation by using it to **compactly bound error** in the network approximation.

$$\left| \int_{-\pi}^{\pi} f(x) - f(\phi_i) dx \right| \leq \int_{-\pi}^{\pi} \underbrace{|f(x) - f(\phi_i)|}_{\leq |x - \phi_i| \cdot \sup_x |f'(x)|} dx \leq 2 \sum_i \left(\int_{a_{i-1} - \phi_i}^{a_i - \phi_i} |x| dx \right)$$

We apply **amplitude-phase Fourier transforms** to rewrite each neuron’s input and output maps. Neurons are **single frequency** with $k_{\text{in}} = k_{\text{out}}$, output map phases are **2x** the input map phase, and the phases are **uniformly distributed**.

$$(A_x)_i \approx a_i \cos(k_i x + \phi_i)$$

$$(B_{xy})_i = \frac{1}{2} (A_x + A_y)$$

$$(C_{xy})_i \approx \text{ReLU}((B_{xy})_i)$$

$$D_{xyz} \approx \sum_i (C_{xy})_i \cos(k_i z + \psi_i) d_i$$

$$D_{xyz} \approx \sum_i \underbrace{\left| \cos\left(\frac{k_i}{2}(x-y)\right) \right|}_{g(x+y,i)} \underbrace{\text{ReLU}\left[\cos\left(\frac{k_i}{2}(x+y) + \phi_i\right)\right]}_{h(z,i)} \underbrace{a_i d_i}_{w_i}$$

Error Bound Type \ Freq.	12	18	21	22
Normalised abs error	0.04	0.03	0.04	0.03
Normalised id error	0.06	0.05	0.04	0.04
Numerical abs \int_0^π bound	0.60	0.41	0.46	0.41
Numerical abs $\int_0^{\pi/2}$ bound	0.45	0.31	0.37	0.30
Naive abs bound	0.74	0.74	0.74	0.74
